

Improving Ophthalmic  
Photographic Diabetic Review  
(OPDR)

Helen King

Programme Manager- Birmingham, Solihull and the  
Black Country DDRSS

# The OPDR pathway

# The History

- Established in 2005 as anticipating 9,000 extra referrals to HES within year 1 of scheme.

## Who gets referred?

- 80% referrals to HES due to M1
- On clinical examination approximately <10% had macula oedema requiring laser at 1<sup>st</sup> visit

# Benefits

# Benefits

- Of 207 referrals due to DR 114 (55%) seen in OPDR
  - 40% returned to AR
  - 50% continued in OPDR
  - 10% referred to DEC

2007 L.Quant, P.Dodson.

# Who should be referred to OPDR?

- Early signs of maculopathy
- Other clinical indications decided by the ophthalmology grader (not for R2)
- Re-photographing patients who have inadequate screening/ visual history
- Patients who have been discharged from HES but still require monitoring

# Special Groups

- Pre-conception Patients
- Ante-natal patients
- Any other cohort of patients with an anticipated rapid 3% drop in HbA1C

VA 6/9

# After OPDR

DISCHARGED TO AR	REMAIN IN OPDR	REFERRED TO HES
Regression of DR	No real changes to DR	Where DR/ VA deteriorates and may require treatment
DR deemed as 'stable'		
Patients who DNA twice		

- To discharge to AR or to refer to HES should be the decision of the ophthalmology grader only

# Impact on Clinical Care

2 months data from BBC Scheme July & August 2010,  
P.Dodson, L.Quant, H.King

East Birmingham	
Screens	1845
Ophthalmology Grading	303 (16%)
Referrals Required	173
(DEC) Urgent DR	13 (8%)
(DEC) M1 & R2	24 (14%)
Remaining in OPDR	29 (17%)
OPDR due to HMA & VA ≥6/12	17 (10%)
OPDR due to exudation	38 (21%)
Unassessable	40 (23%)
Non-DR referrals	12 (7%)

**31% of new referrals were referred to OPDR rather than HES**

# Down side of OPDR

- No medical assessment of patients with early changes.
- Educated guess-work as to who has Macula Oedema and who doesn't
- Grader has risk of clicking 'no-change'
- Expense of IT involved

# Antenatal OPDR

- Following the 1st antenatal clinic appointment
- Normal screen at 28 weeks
- Abnormal screen at 16-20 weeks

-Any signs of STDR - urgent referral to HES

Any other patients with radical improvement of glycaemic control.

# Audit results-Ante-natal OPDR

Over 33 months 187 pregnant patients were screened and audited.

- 18 (10%) referred at 1st screen
- 23 (12%) DNA'ed follow up appointment and didn't attend again

The remaining 146 (78%) were screened digitally following protocol to completion of pregnancy.

- 94 (64%) did not develop DR at any stage

# Combining with OCT

- Since 2008 we have used Zeiss Stratus OCT in combination all OPDR patients referred due to maculopathy
- Precision when defining if a patient is referable
- Comparison of images and scans

# Combining with OCT

# Results

- **M1 (HMA + VA  $\geq 6/12$ ):**  
N=49 only 16% thickening on OCT (only 6% true DR)
- **M1 (exudation):**  
N=135 22% showed thickening on OCT  
(77% 1DD, 23% 2DD)

On Referral (1<sup>st</sup> appointment) -27% lasered  
-10% discharged  
-13% DNA  
-50% monitored

17/06/09

VA 6/9 ph

R1M1

OPDR 6 months

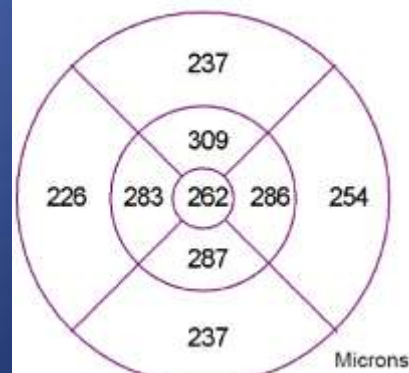

16/12/09

VA 6/6 ph

R1M1

Refer to HES

VA 6/9

# Clinical Significance

- Macula photographic grade v OCT oedema  
Sensitivity 28%
- 84% patients with HMA + VA $\geq$ 6/12 went back to AR.
- 78% patients with exudation within 1 or 2DD could continue within OPDR safely.

# Conclusion

- OPDR is an excellent way to monitor patients who are refrerrable by definition- but have a small chance of having STDR.
- OPDR can be utilised for high-risk groups.
- OPDR combined with OCT gives more precise decision on whether to refer patient to HES

# Thank you for listening!!

- Special thank you to H.Wharton and P.Dodson for support

# Referral criteria for OCT stratus

- 1. Central foveal thickness  $>250\mu\text{m}$
- 2. Other area  $>300\mu\text{m}$
- 3. Abnormal retinal appearance on the fundus photograph
- 4. OCT thickening corresponds to retinal abnormalities (localised/diffuse)
- 5. Hotspot (OCT cross-section) & asymmetric
- 6. Definite red or white seen on the OCT thickness map
